DAY 21 | PRE-READ

Opening Day for Your App

A light read before Day 21. About 15 minutes, no code required.

Prepared by **Ahmed** | linkedin.com/in/ahmed-al-imaad

Why read this?

Yesterday you packed your app into a container and added security gates. Tomorrow you put it on the internet using Microsoft Azure, and set up a pipeline that delivers every approved change automatically.

1. The same box, different addresses

A food truck is the same truck whether it parks at a festival or outside an office. Only the location and the menu prices change. A cloud-ready app works the same way: the same container runs in a test environment and in production. Only its settings change, such as which database to use.

2. Where to park the truck

Azure option	Everyday comparison	Good for
App Service	A rented shop with staff who keep it running	Most web apps and APIs
Container Apps	A market stall that grows or shrinks with the crowd	Containers that need automatic scaling
Kubernetes (AKS)	Running your own shopping mall	Large platforms with dedicated teams
Virtual machine	Renting an empty building	Special or legacy software

Key idea: choose the simplest option that meets the need. Simple systems are easier to keep running.

3. Releases with a safety gate

Many teams first release to a test environment, check it, and only then promote the same version to production. A person can approve the final step. Azure DevOps calls these **environments**, and the approval is a gate.

4. A safe for passwords NEW (v4)

Apps need passwords, for example to reach a database. Writing them in the code is like taping the shop key to the door. **Azure Key Vault** is a locked safe for passwords and keys. But the app needs a key to open the safe. A **managed identity** solves this: Azure itself vouches for the app, like a staff badge, so there is no key to lose.

5. Think about these before class

- What settings would differ between a test and a live version of an app?
- Why should passwords never be written inside the app's code or pipeline files?
- Who in a telecom company would approve a production release, and what would they check?
